

MEASURING YOUR BOAT

The SeaPen is a water-level dry-docking system and as such, the waterline dimensions of your boat influence the sizing of the SeaPen. We gauge the waterline length of the boat as being taken from the towing eye at the bow of the boat to the stern-most point at water level. The diagrams below demonstrate this for different boat styles. Shaft and keep boats also require the draft to ensure the correct skin depth is manufactured.
